Thermowood

main uses

Thermowood is a kind of Modified Wood, in which wood is subjected to one of two types of heat thermic treatment (185/190° - ThermoS - Stability or 200/212° - Thermo D - Durability) and water steam, it is a 100% natural (it does not contain chemical products), and it is hygienic and ecologic (burning and recycling of excess material are perfectly safe).

With this treatment, there is an improvement in wood dimensional stability (with reduction of balance humidity) and a high durability (by thermic insulation and drying and resin removal, avoiding rotting and fungus).

Wood acquires, uniformly, a Brown color with a smooth surface, pleasant to the touch.

Thermo D wood is a type of wood ideal for outdoors, which its main uses are: outdoor lining/ coating and deck (for swimming pools, terrace, pathways, balconies, courtyards).

Thermo S wood is used indoors: floors, lining, frames, ceilings, walls, panels, furniture, saunas, and stairs, among others.

GLOBALDIS supplies Thermo-D wood in raw material, and as a finished product, as in the case of lining/ coating deck, logs or shaped.
