GLOBALDIS
FOR YOU, TODAY

GRUPO VICAIMA

The solid wood deck allows you to create environments in perfect harmony with nature. It is a flooring that is easy to apply and maintain, especially suitable for outdoor use or in areas subject to humidity, and provides unmatched comfort and aesthetics.

Wood species (100% natural material)

Natural hardwoods such as Massaranduba, Cumaru, or Ipê, are the most recommended to ensure durability. However, other less dense species such as Kambala or Zazange, are also suitable for this type of application. Variations in shade, knots and veins form the true identity of wood and enhance its beauty.

Application of the deck rules must ensure the following:

- It must be perpendicular to the direction of the slat.
- Each end of the deck strip must cover a slat and be fixed there (with screw or handle).
- The strips must have a spacing of from 5 to 10mm, so as to allow the wood to expand under the weather conditions. If there is a wall or barrier at the perimeter of the application, the space between the strips must not be less than 9mm. If necessary, use a gauge to obtain a certain spacing.
- A bolt (visible fixation) or fastener (concealed) must be applied at each point between the strip and the gauge.

MAINTENANCE...

Solid wood decking is a 100% natural and living product, as such it undergoes the natural environmental effects, especially if applied outdoors, such as sun, wind and rain. If the natural grey colour of the wood does not meet the preference for decoration, some maintenance is necessary to preserve its original appearance.
